# UNITED STATES PATENT OFFICE 

William $\Gamma$ Triedman, Washington, $D$ C<br>Application October 191939 Serial No 300212<br>19 Clams (Cl 35-2)<br>(Granted under the act of March 31883 as<br>amended Apial 30 1928 370 O G 757)

The invention described herein may be manufactured and used by or for the Goveinment for governmental purposes without the payment to me of any royalty thereon

This invention relates to cryptographic devices and has fol its object the plovision of a handoperated device capable of affording a relatively high degree of security without involving the use of complicated mechanisms
Another object is to provide a device useful in cryptographic and cryptanalytic investigations requiring the use of sliding alphabets

The invention is descirbed with ieference to the accompanying drawings in which
Fig 1 is a perspective showing one foim or embodiment of the invention
Fig 2 is a top plan viẹw of another embodiment of the invention
Fig 3 is a cross-section taken on the line 3-3 of $\mathrm{Fig}_{2}$

Fhg $3 a$ is a fragment of the same section on an enlarged scale showing the T-grip for the gulde rule in operative position

Fig 4 is a top view of the form of invention of Fig 1 showing the gulde rule in shifted position

Fig 5 is a top plan view showing another embodiment of the invention in which the base is composed of separate detachable grooved sections

Fig 6 is a perspective showing one of the grooved sections and
Fig 7 is a perspective showing a frame stiucture and sub-base on which sald grooved sections may be assembled

Referring to $\mathrm{F}_{1 \mathrm{~g}} 1 \mathrm{in}$ this embodiment the device comprises a base I on which are horizontally fastened a series of cylindrical iods 2 forming a set of channel ways 3 into which character bearing strips 4 may be inserted and slid from left to right oi vice versa In the specific embodiment disclosed herem the device comprises twenty-five such channel ways but the device is by no means limited to this number The number chosen in this embodiment is merely a convenient number and it may be increased or decieased within certain limits in other embodiments without materially depaiting from the spirit of the invention A rule or leading guide 5 attached to a reading guide slide 6 can be slid to the left oi right on a reading gulde shde rail 7 End bars 8 and 9 serve as stops against which the reading guide 5 may be brought at the end of its travel to the left or right To the back of the base 1 is fastened a hinged support 10 which can be pulled out to support the device in a slanting position as
it rests upon a table desk or other plane surface Or if the operator prefers to lay the device flat upon the table the rubber feet 11 at the four corners of the bottom of base I will support the 5 device and keep it from sliding about on the table
As stated above anto the channel ways 3 there are inserted character strips 4 of paper or other suitable mateial, heremafter called alphabet
10 stıips upon which appear sequences of lette $s$ of the alphabet each sequence being repeated on the stip and the letters being equidisuant from one another thioughout The purpose of the duplication of sequence will appear presently 15 The letters on the alphabet strips may be in normal order or in disarranged ordel if the latter the vailous alphavets may or may not be different Assuming howevel different alphabets are being used each strip bears an identifying 20 maik such as a number 14 so that the alphabet stips may be inserted into the channel ways 3 according to some preagreed key For example in Fig 1 is shown a set of twenty-five channel ways into which twenty-five different alphabet 25 strips 4 have been inserted according to the following key reading from the top downward
14-16-9—6-22-25-23-5-12-24-13-21-
18-1-7-17-20-19—15-8-11-2—3-10-4
30 If another embodiment of the device should include more than twenty-five channel ways additional alphabet strips may be inserted according to a longer key
Having inserted the alphabet strips into the channel ways in key order the device is now ready for use either to encipher a plain language message or to deciphel a cryptogiam which has been enciphered by means of the device alphabets and key shown in Fig 1 Suppose this plain-text message is to be encrphered

## ACCORDING TO AN OFFICIAL REPORT

 FROM MILITARY AUTHORITIESMoving the reading guide 5 to the left and 45 bringing it against the left end bar 8 the operator pioceeds to align in a column immediately to the night of the reading guide the first twentyfive letters of the message This is most conveniently done by placing the eraser end of a pencil
50 upon the successive desired letters as found on the successive alphabet strips 4 from the top downwaids and pulling or pushing the alphabet strips in their channel ways toward the reading guide so that each strip stops with the proper 5 letter just to the right of the right-hand edge of
the reading guide 5 When the alphabet strips are being aligned on the left-hand side of the device as in the above procedure the operator confines his search for letters to the left-hand half of the duphcated sequence on each alphabet strip

When all twenty-five alphabet strips have been aligned as indicated there is disclosed a mulitplicity of columns of letters to the nght of the plain-text column of letters thus aligned All these columns of letters except one are columns of cupher letters each column representing a cupher equivalent of the plain-text column The single exception is the column which is the twenty-fifth semoved fiom the plan-text column set up by the operator and is meiely a repetition of that plain-text column One of these cipher columns is selected at random and is lecorded in five-letter groups The reading guide 5 is useful in this operation since by placing it alongside the column selected readmg of the copher column is facilitated Suppose that the reading guide 5 be moved so that its left-hand edge aligns a column of cipher text As shown in Fig 4 such a column would read as follows
SNAFJ LXRJG GVWVA ATVWW PVNUT
These letters ale recorded and constitute the cipher letteis for the twenty-five plain-text lettels

The leading gude 5 is now moved to the extieme light of the device up against the rignt end bar 9 the next twenty-five letters of the plain text are aligned against the left edge of the reading guide 5 Again a set of columns of cipher letters are disclosed to the left of the reading guide One of these columns is selected at 1 andom and again a set of twenty-five cipher letters representing the second set of twentyfive plain-text letteis is recorded If the message contains more than fifty letters the foregoing piocedure is iepeated until the entire message has been enciphered Thele is no need to indicate to the recipient of the message which column is selected for the cipher equivalent of each set of twenty-five plam-text lettens as will be noted piesently

To decipher the message having the alphabets and the key according to which they have been arranged the operator merely proceeds as $n$ encipheiment aligning the alphabet strips in their channel ways so that the first twenty-five ciphei letters of the cryptogram are in one column He then examines all the other twentyfive columns of letters looking for one which contains intelligible text throughout its extent from top to bottom There will be one and only one such column and this will be the plamtext equivalent of the column of cipher text set up on the device The reading guide 5 is useful in this seaich for the plain-text column $n s$ it can readly be moved to scan the successive columns from left to right or from right to left The plain-text column thus found is recorded in word lengths and the operator proceeds to set up the next twenty-five cipher letters on the right-hand side of the device Agam he looks for a plain-text column and recoids it when found He continues this process untal the message has been completely decıphered

In the form of invention shown in Fig 2 the device comprises a pair of hinged components F-F of metal Bakelite or other suitable matenal and foldable on one another in the manner of a book As here shown the grooved slide-
ways 3 are formed on the inner faces of the said components by milling or in the case where a condensation product such as Bakelite is used may be molded in the material In the embodi5 ment disclosed there are a lotal of thirty such slideways fifteen in each component though it will be understood that the invention is not limited to any particular numbel it will be noted that the slideways ale open at their opposite ends 0 so that the alphabet strips may be readily inserted and fieely extended outwardly theiefrom as they ale slid into different positions in the operations of enciphering and deciphering As in other forms of the invention a T-gip 6 is at$\delta$ tached to the guide rule 5 at als end for the purpose of manipulating the rule and is slidable in a channel 20 having therem undercut grooves 21 and 22 formed laterally along its inside edges The giap 6 is provided with a sping-piessed element 23 engaging in bottom gioove 21 and having an oppositely dusposed bead 24 engaging in the opposite gioove 22 whereby the gip 6 is maintained under suitable sliding tension in the channel 20 and whereby the guade rule 5 is manipulated transversely in relation to the alpnabet stips 4 and the opposite end of the rule is adapted to shde fieely in a lateral undercut groove 25 foimed in component $F$ The grip 6 is igidly secuied to the guide iule 5 in the man30 ner of a T-square and may be so manipulated that the rule affords a positive means of obtaining an accurate alignment in column formation of the chaiacters on said alphabet strips and in valying relations for ciyptographic purposes This foldable form of device presents a number of practical advantages among which may be mentioned its compactness and portability also the foldable feature permits exclusion of dust and dirt
While in one form of device here disclosed cyindincal rods ale secured to a base at regular intervals from one anothel to form the channel ways into which the alphabet strips are inserted it should be understood that any other means 45 may be employed to form the channel ways Fol example a series of elongated metal strips known in the tiade as cald holders' used ordinanily to hold nairow stıips of paper bearing names of mall-box owneis in apartment houses etc may be used to form the channel ways these card holders may be riveted to the base, or spot welded to $1 t$ or attached in any othen suitable manner Or as disclosed in connection with Frg 2 the channel ways may be formed by milling grooves in the base I itself which may be made of molded Bakelite for example In such case the grooves are made by a rotating cutter which undercuts at the two edges, forming a channel way such as is commonly found in shde-rules Figuie 6 shows such a section in the form of a piece of Bakehte or similar material 13 in which five such channel ways 3 have been cut Sections with equal or unequal numbers of channel ways may be easily plovided and given identifying symbols such as letters A B C

In Fig 7 thele is shown a sub-base suitable for use with such sections of channel ways Thus instead of having all the channel ways on a single 70 base as is the case in Fig 1, the sub-base is melely made in the form of a flat surface onto which sections of channel ways may be positioned and temporarily fixed so that rear rangements of sections can be made according to subsidiary keys, 75 Refering to Fig 7 the sub-base $I a$ is a plane

- surface which is provided with an undeicut slot 14 for carrying a sliding clamp 15 provided with a knuiled thumb screw 16 for fastening the clamp into position End bars 8 and 9 elevated above the base by supports 17 and back stop 18 serve the same purpose as similarly designated end bars of $\mathrm{Fig}_{1}$

Using a sub-base such as that shown in Fig 7 with several sections such as that shown in Fig 6 one method of operation of this embodiment of the invention is shown in Fg 5 In that figure there are five sections of 3457 and 8 channel ways giving a total of twenty-seven channel ways FIrst the sections are temporarily fastened to the base in the alphabetical oider of their identifying symbols Then the twenty-seven alphabet strips would be inser ted in the twenty-seven consecutive channel ways according to the pledetermined numeilcal key already referred to above in connection with Fig 1 To encipher a given message there would then be a subsidiary or specific hey also allanged for in advance by means of an indicator in the message which would dnect that the sections be now placed onto the base in a mixed oider say E-D-A-B-C as shown in Flg 5 The encipherment of a message would then pioceed exactly as before In another message tle indicator for the sectional airangement might be diffeient say one calling for the sequence of sections D-A-C-E-B Thus wath five sections there could be 120 different ariangements of sections on the base even though only one set of alphabet strips is employed The purpose of this is of course to increase the keying possibuities of the device and to impart uniqueness to successive messages without going to the $t$ ouble of making a complete reariangement of all alphabet stips in the set of twenty-five channel ways

The many uses of this device with variable alphabets in ciytographic or cryptanalytic studies will be apparent to all skilled in the art and nothing furcher need be said on this score except that there has existed for many years a hithel to unfulfilled need for a simple device of this type suitable for the insertion of sliding alphabets

Changes modifications and equivalent arrangements are contemplated withon the scope of the invention as defined by the appended claims

I clam
1 A cryptogiaphic device comprising a base provided with a plurality of horizontal channel ways strips piovided with discrete sequences of equally spaced alphabetic characters adapted for insertion therein and adjustable independently of one another and means for facilitating the reading of sand characters in selected columns

2 A cryptogiaphic device comprising a base said base being provided with a plurality of vertical channel ways and individually adjustable stirps beaing disciete sequences of equally spaced alphabetic characters adapted to be slidably inserted therem and means for facilitating the reading of said characters in selected columns and in different relations for ciyptogiaphic purposes

3 A ciyptogiaphic device comprising a base formed with horizontally giooved slide-ways therein individually adjustable alphabetic strips slidable in sald ways and means to facilitate the reading of selected alphabetic columns in vaiying relations for ciyptographic purposes
4 A cryptographic device comprising a base formed with grooved slide-ways therein, stıps
bearing thereon alphabetic character sequences and individually movable in said ways, and means adjustable transversely of said strips to facilitate the reading of said characters in varying relations for enciphering and deciphering messages

5 A cryptographic device comprising a base having veitically giooved slide-ways formed therein strips bearing thereon alphabetic character sequences and individually shdable in said ways and means adjustable transversely of sald stips fol facilitating the leading of said characters in varying relations for enciphering and deciphering messages
6 A cryptographic device comprising a base provided with a plurality of channel ways alphabet bearing strips adapted to be individually inserted and aligned $m$ varying relations in said ways for cryplographic purposes and a slidable guide rule for making excursions transversely along the channel ways and in relation to said strips for encipheing and decipheing messages

7 A cryptographic device comprising a base hav ng $\tau$ suppoiting foot hingedly attached to the undry suiface of said base a plurality of members fiyed to the obverse surface of the base at equidistant intervals to form a plurality of channel ways stips bearing alphabetic sequences of characters mdividually slidable in said ways a gude rule adapted to be moved transvelsely of said stips to facilitate the reading of selected sequences of characters in varying relations for clyptographic purposes and stop members for the guide rule disposed at ooposite ends of sald chennel ways

8 A cryptographic derice comprising a subbase interchangeable base-sections having grooves formed theren to provide a plurality of channel ways means for removably attaching sald sections in position on said sub-base to permit different arrangements of said sections in juxtaposed relationship for cryptographic purposes chaiactei bearing strips adapted for slidable insertion in said channel wnys and a slidable gurde iule movable transversely across said channel ways and in varying relations to said strips for enciphering and deciphering messages
9 A combination according to claim 8 in which said giooved sections are of the same size and contain equal numbers of channel ways
10 A combination according to claim 8 m which said grooved sections are of different sizes and contain unequal numbers of channel ways

11 A combination according to clam 8 m which stops are provided at the opposite ends of the channel ways to limat the movement of the shide rule at the end of its travel
12 A cryptographic device comprising a frame stiucture and including a sub-base formed therein a series of base-sections having grooves therein to provide a plurality of channel ways means for iemovably attaching said sections on sald sub-base to peimit different ruxtaposed arrangements thereof for cryptographic purposes strips bearing alphabetic sequences of characters slidable in sald ways and a slidable gude rule movable transversely of said strips and alignable in varying relations with iespect to said characters for enciphering and deciphering messages

13 A cryptographic device comprising a frame stiucture and including a sub-base therein base-sections grooved to piovide a plurality of channel ways, said sections having dufferent numbers of said channel ways and being differentiated from one another by distinguishing symbols, means fol detachably securing sald sections
on the sub-base to permit dufferent juxtaposed arrangements thereof for cryptographic purposes strips beaing alphabetic sequences of characters movable in said channel ways a guide rule slidable tiansversely of said strips and alignable in varying relations with said characters for enciphering and deciphering messages and stop members at opposite ends of the channel ways to limit the movement of the slide rule at the end of its travel

14 A ciyptographic device comprising a multiple base formed of separate sections said sections being interchangeable with one another to permit different juxtaposed arrangements for cryptographic purposes a plurality of channel ways in sald sections strips bearing sequences of characters and individually slidable in said ways and a guide rule movable transversely of said strips and alignable with said characters in varying relations for enciphering and deciphering messages

15 A cryptogiaphic device including a multıform base composed of separate sections sald sections having glooved slide-ways therem and being interchangeable with one another to permit dufferent juxtaposed arrangements for cryptoglaphic purposes strips slidable in said ways and bearing theieon sequences of alphabetic chaiacters and gude means disposed transveisely of said strips and movable to facilitate alignment of the characters in varying relations for encipheing and decipheing messages

16 A cryptographic device composed of hinged sections foldable upon one another said sections having grooved slide-ways formed on their inner faces, strips slidable in said ways and bearing thereon sequences of alphabetic characters, and gurde means disposed transversely of said strips and movable to facintate alignment of the char-
acters in varying relations for enciphering and * deciphering messages

17 A cryptographic device composed of hinged sections foldable upon one another, said sections being piovided on then inner faces with openended slide ways strips slidable in said ways and bearing thereon sequences of alphabetic characters and a guide rule hinged to fold with said sections said iule being disposed transversely of said stilps and movable to facilitate reading of the characters in varying relations for encipheiing and deciphering messages

18 A cryptographic device comprising a pair of hinged components foldable upon one another, said components being provided on their inner faces with open-ended slide ways a guide rule hinged to fold with said components means operative with one of sald components to maintain said rule in a position transveisely of said strips and movable to facilitate reading of the chaiacters in column formation and in varying relations for encipheing and deciphering messages and termmal stops to lumit the movements of said rule at either end of its tavel

19 A cryptogiaphic device comprising hinged components foldable upon one another sald components being provided on their inner faces with a plurality of slide ways a guide sule hinged to fold with said components a grooved channel formed along the edge of one of said components in paiall.lism with the slide ways means including a spring-tensioned element slidable in said channel for operating the said rule while mantaining the same in a position transversely of said strips sard rule being movable to facilitate reading $o^{f}$ the chaiacters in varying relations and in column foimation for enciphering and deciphering messages
