 (TMise Lar rilana \& Iraining Divigion)

1. There is attachea herwto a sketch and deacription of an indicenting device lavented by ate on March $60,1926$. This device is not \& cryptographls deviee hut it may bu used as a telegrenk: device, sither recording or nonrecording. It is desired to patent this invention.
2. Informantion is re uasted at to whether I mey obtaln a mient on thia devioe through the Patent Stetion of this ofrtee.

*illiam Y. Priedman

## Indicating Device

1. The device to be deseribed may be used for several plarposes, of

## Thich the following are obvious:

a. For interconnectiag. two offices at a lecal headquarters, so that
a keybeard operated at a calling atation will indicate words,
letters, numbers, or combinations thereof at the called etation.
b. For advertiaing parposes, as a device for attracting attention
by spaling out in letters and figures the adrertisement.
2. The device is disclosed in the accompanying Fig. 1. The mechanism there shom is adapted to indicate the 26 letters of the alphabet and the digits $2,3,4,5,6,7$, and 8. (The letter "I" can serve for the dight
 additional characters may be employed, or even groupings of characters in the form of words, pletures, otc. How this is possible vill become apparent from a consideration of the syatem.
3. In Fig. I, a tatal of 34 charactore is to be repreaented. A keyboard for setting up permutations in accordance with a b-unit code is provided. Lat the plural unit character code be as follows

| $t+ +++ \pm 2$ | + + - + + ${ }^{\text {B }}$ | +-+---4 |
| :---: | :---: | :---: |
| + + + + + - к | + + - + - D | + - - + + + |
| + + + + + - + | $++---+2$ | $+--++\cdots$ |
| + + + + + - - | + + - - - s | +--+ー+ |
| + + + + + + ${ }^{\text {a }}$ | $t-+++{ }^{+}$ | $+--+-5$ |
| + + + - + - J | + - + + + - c | + - - + + 0 |
| $+++--+$ | + $-++\sim+p$ | +---+-6 |
| + + + - - - | +- + + - - I | + - - + + |
| + + - + + + | + - + - + + | 7 |
| + + - + + - | +- + - + - | $-++++{ }^{+}$ |
| + + - + - ${ }^{\text {r }}$ | $+-+--+\mathrm{L}$ | -+++ - ${ }^{-9}$ |
| + + - + - s |  |  |

(The permatations assigned to the Letters of the alphabet correspond in their 2nd, 3rd, 4th, 5th, and 6th elements with the Baudot 5-unit code.) The 6 permutation pairs of the keyboard control the 6 contact levers show at 1 of Fig. 1. They each have 2 contacts. At 2 there is shown a homologous set of 6 contact levers and associated pairs of contacts. These contact levers are controlled by pins which project from the periphery of an indicator wheel 3. Means are provided to keep the indicator wheel in constant rotation. The periphery of the indicator wheel has a translucent or transparent window running all around it and this window is divided up into 34 equal segments on each of which is painted
one of the 34 characters. For visual indications a lamp 6 is placed within the interior of the indicator wheel and close to the surface nearest the point of observation. It will be noted that this lamp will be illuminated only when the 2 sets of contact levers at 1 and 2 are in homologous positions with respect to their associated left and right contacts. As the keys corresponding to the successive characters to be indicated are depressed at the keyboard of the calling station, they are illuminated successively at the called station. Another method of operation would be to cause the comparison circuit to stop the indicator wheel in its rotation from a starting position, at the selected position determined at the keyboard.

The same basic mechanism may be employed for making a printed record. Instead of a transparent or translucent window in the periphery of the indicator wheel let this be replaced by a band containing embossed characters. Instead of the lamp let the comparison circuit actuate a magnet which causes a paper tape to be thrust against the type band at the instant the comparison. circuit is completed and at the same time let the tape be adranced.

In the foregoing syetem there are 34 characters but with a 6-unit code it is possible to provide for the indication or recording of a total of 64 characters.

For connecting the calling station with the called station a 12-conductor cable will obviously be required. Since this system is intended for inter-

Fer advertigtag perrpesetry there is of coumeen objeotion in having
 which weulif require the omployment of asp operater, it is poenible to operate
 by means of a rotating dinum: whon which pine can be set ap to correspond to the succepsive effacractere to be indicated OMy the size of the drum will
 be made with demorntivite plire; oc that pin permatationg corresponding to

 In newaplaper offitoets. Thre onds of worde could be indicated by a dash; "comma" and "period" migiat" beaddedt, at mell as other mecessary. characters.

Addendum to Invention of Indicating Device.

1. The system described above can be used for telegraphic purposes by more or less aimple extension of the principles described, as noted below.
2. Suppose that the local and distant stations are provided With identical rotating wheels synchronized by start-stop impulse, so that the rotating drums start simaltaneously and make their revolutions at practically the same rate of speed.
3. Let the comparison circuit then actuate a line or signal transmitter relay at the same instant that it shows or records a local signal. Then at the distant station, when the signal arrives It will cause the same indication or record to be made, since the two drums are in synchronous operation. At the called station, accordiag to this method of operation, the comparison oircuit is not in operation for receiving purposes; the comparison circuit is in operation for transmitting purposes only, and either station can operate in this respect, alternately.

Filliam F. Friedman.
