## Dear Friedman:

As I understand it, you are not questioning the basic relationship of XX to 18470 - on this po nt there can be no question - but the wry in which this relationship was expressed in the printing of the codebook. I have assumed a two-part code; you prefer the idea of af alphabetical arrangement only, with tables of one kind or another for enciphcering this arrangement.

When 1 was in washington for the Mixed Claims Commission (193zid I showed, you an arrangement of this kind that 1 had worked out. As I put it then, it was an arrangement by which a single printing might be made to serve for both encoding and decoding. You were not impressed - and I myself was not convinced a possibility was all 1 called it.

I' shall reproduce this arrangement here. It is a bit awkward to use, and I am ofriad that its use might invite errors. On the other hand, because of the random rearrangement of the blocks - of - ten in going from XX to 18470 there can be no simpler method.

I do not believe the v did it this way. On the other hand the idea may be worth incorporating in my paper in the form of a footnote.

On the accompanying sheet 1 am taking a hypothetical page, omitting the vocabulary, and making a random arrangement of the blocks-of-ten.

If such an arrangement vas used it ans for 18470 only - not for 80574 , 1777, etc., etc. 'these are not coordinate in compilation with 18470, because 18470 has, on page 184, the ten grow is assigned to "Chiffre Number" a positive sign that the original vas of 18470 only. All the brothers and sisters arrived later and were used by means of page tables. Their blocksoften differ from those of 18470 systematically (see my paper on Additional Codes of the 18470 Family), and that is just the difference between their relationship to 18470 and the relationship of 18470 to XX.

It is not impossible, but, in my opinion, all but impossible that a detailed study might show that the different rearrangements of the blocks-of-ten in going from XX to 18470 are limited in number, and repeated with some system. In that case a table might be devised for these changes in connection with a formula showing that pages ....... will have rearrangement $A$, pares ...... rearrangement $B$, etc. This study could easily be combined with one to determine the position of the stops and the numerals on the page. Ind be glad to make it, but should, of course, have to have the 18479 code-book; Id need 1.040 too as a check on blank blocks.

It was nice to see you here. I hope that by this time going without tobacco has so improved your state of health that you have again begun to smoke.
